## Breeding Indices

Source – DataGene Technote 26

The Balanced Performance Index (BPI) and Health Weighted Index (HWI) both account for traits that affect a cow's lifetime contribution to their dairy business: production, health and fertility, feed saved, workability and type.

The BPI is measured in \$, compared with the breed average or base which is set at zero. HWI places more emphasis improving traits such as fertility, mastitis resistance and feed saved than BPI. Breeding for HWI is expected to reduce cow size and show little improvement in production.
